

## Create Layers from Selected Features

When features of a layer are selected a new layer can be easily created from the subset of data.

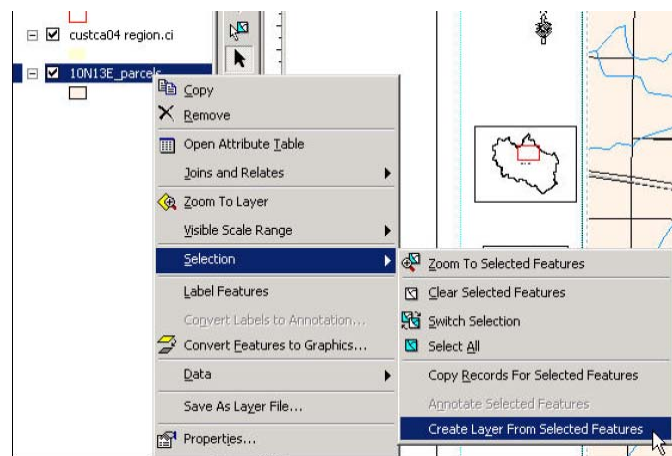

Note: When a layer is created by using the process Create Layer from Selected Features the new layer displayed in the table of contents will retain a live link to the primary layer. Any change to the new layer will result in a change to the primary layer.

Once the features are selected, right-click on the layer in the table of contents.

In the menu move the cursor over selection and a drop down window will appear.

In the following menu choose Create Layer from Selected Features.

The new layer is automatically added as the top layer in the feature data set.

This concludes *Create Layers from Selected Features*.

Watch “Create a Shapefile from Selected Features” to create an independent data file.
